The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for caracterising cells, e.g. for determining the origin of a cell; its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction containing the pattern of gene expression in a selected gene family. Sequences Asiles of gene expression in a selected in the RT-PCR reactions to determine the pattern of gene expression. The

The invention relates to amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence comprising providing a center-associated DNA sequence comprising providing a cemplate bolymucleotide, ligating a loop-forming oligonucleotide to the 3'-end of the sense strand, annealing the loop-forming oligonucleotide with the first portion to generate a panhandle structure, subjecting the panhandle structure to extension, and subjecting the panhandle structure to extension, and subjecting the panhandle structure to extension, and subjecting the method of a cancer-comprised DNA sequence, the template polymucleotide comprises a sense strand, comprising the known and unknown region of a cancer-comprised DNA sequence, the template polymucleotide comprises a first or second portion. The lunknown region is complementary to the sense strand than is the known region. The hoop-forming oligonucleotide is complementary to the first portion. The third region of comprises ATP1 (not defined) or the first portion. The method is useful for amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence. Also disclosed as new is the use of the method in the analysis of the breakpoint regions with AF-4, CDK-6 and SEPTING and are associated With ALL and AML (acute lymphoblastic leukaemia and acute myeloid leukaemia). MLL is located on chromosome the unknown region adjacent to the BCR cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; ds; human secreted protein.
                                                                                                                                                                                                                                                                                                 Amplifying an unknown region that flanks a known region of a cancerassociated DNA sequence by subjecting the panhandle structure to extension and to PCR in the presence of a first primer homologous to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel method for determining the genetic risk of arteriosclerosis both for clinical diagnosis and for population studies. The method comprises: (i) selecting risk-associated reference nucleic acid sequences, including their functionally characterizing mutations; (ii) applying probes from these sequences, or their complements, to a carrier, (iii) hybridising the probes with a nucleic acid from (or synthesised from) a patient sample, and (iv) detecting and evaluating the hybridisation pattern. The method provides a quick, in expensive and informative diagnosis, and makes possible a quick, in mutations or mutations that when present alone carry no risk but are risk mutations or mutations that when present alone carry no risk but are risk associated in presence of other mutations. The results may be combined with known risk-assessment methods to provide a more reliable diagnosis, especially important with new therapeutic methods (e.g. gene therapy) that are directed against specific genes. All relevant mutations in a reference sequence can be screened for in a single test and the method is vell mutations the combined for in a single test and the method is vell mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; 88; MLL; cancer; AP-4; CDK-6; SEPTIN6; ALL;

New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                               The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and irreating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The sequence represents a human secreted protein encoding sequence. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; T-cell associated disease; Wheta; autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome; allergy; type II hypersensitivity; Goodpasture's syndrome; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠ
                                                                                                                                                                The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers especifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant redection and diagnosing and treating T-cell associated diseases including autoimmune disease, Appersensitivity disease, infectious diseases including autoimmune disease, Autoimmune diseases include Addison's disease, and neoplastic disease. Autoimmune diseases include Addison's disease, and neoplastic disease. Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple atrophic gastritis. Degenerative nervous system diseases include Type I hypersensitivities such as those present in allergies. Type II hypersensitivities such as those present in cologasture's syndrome and Type IV hypersensitivities such as those caused by arrases such as HUY, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                          Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                                                                                      PCR primers AAV30066-67 were used to amplify the IL-12 p40 sununit from normal uninfected human peripheral blood monouroleocytes activated with Staphylococcuc aureus. The amplified product is cloned and used to exemplify the invention, which describes a method for treating intracellular infections of warm-blooded mammals. This comprises administering to the mammal a vector construct which directs the expression of at least one immunoscript portion of an antigen derived an intracellular pathogen, and also administering a protein which comprises the immunogenic portion of the antigen. The composition is used to treat intracellular infections within warm-blooded animals e.g. bacterial infections such as legionella, tuberculosis and chlamydia, parasitic infections such as rickettsia, leshmaniasis or malaria and
                                                                                                                                                     Vector construct directing expression of intracellular pathogenic antigen - useful for, e.g. treatment of intracellular diseases in animals such as tuberculosis and chlamydia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis B; hepatitis C; immunogen; HBV; HCV; hepatocellular carcinoma; HCC; gene therapy; virucide; hepatotropic; antiinflammatory; cytostatic; PCR primer; human; peripheral blood mononucleocyte; PBMC; interleukin-12; IL-12 p40 subunit; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a gene sequence encoding 23S rRNA of Pectinatus cerevisiphilus (ABL54507). The invention includes a series of oligomucleotide probes including: a sequence (ABL54508-ABL54519) targeting 23S rRNA of a Pectinatus genus microbe for detecting P. cerevisiphilus or its complementary sequence, a sequence (ABL54520-ABL54531) targeting 23S rDNA and 23S rRNA of a Pectinatus genus microbe for detecting P. frisingensis or its complementary sequence; a sequence (ABL54532-ABL54540) targeting 23S rDNA and 23S rRNA of a Pectinatus genus microbe for detecting a Pectinatus genus microbe. The method can be used for detecting a Pectinatus genus microbe. The
                                                                                  The present invention relates to a method for treating hepatitis B or C infections. The method involves administering a vector construct that directs the expression of at least one immunogenic portion of hepatitis B virus (HBV) antigen, containing HBeAg, HbcAg, HbsAg, S, Pre-S1, Pre-S2, open reading frame (ORF) S, ORF 6, HBV pol or HBxAg or co-expression of at least one immunogenic portion of a HBV antigen and at least one immunogenic portion of a hepatitis (HCV) antigen. The vectors are useful in gene therapy, particularly for treating or preventing hepatitis B and hepatitis C infections, as well as hepatocellular carcinomas (HCC). The present sequence is a PCR primer used for amplifying IL-12 (interleukin-12) p40 subunit of human peripheral blood mononucleocytes (PBMC) used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pectinatus bacteria in beer, from the microbes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for treating intracellular infections within warm-blooded animals comprising administering to a warm-blooded animals wethin warm-blooded animals are according to a manal and a vector construct which directs the expression of at least one immunogenic portion of an antigen derived from an intracellular pathogen, an immunogenic portion of the antigen to generate an immune response. The method is useful for treating intracellular infections or diseases including viral infections (e.g. hepatitis B virus (HBV), hepatitis C virus (HIV) or feline immunodeficiency virus (FIV)), parasitic infections (e.g. rickettsia, leishmaniasis or malaria) and certain bacterial diseases (e.g. legionella, tuberculosis or chlamydia). Sequences ABX96883-ABX96937 and ABX96940-ABX96965 represent PCR primers used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating intracellular infections, e.g. viral, parasitic and bacterial diseases, comprises administering a vector construct which directs the expression of an immunogenic portion of an antigen from an intracellular
Sindbis virus. This sequence represents a PCR primer used in the method of the invention

This invention relates to a composition comprising a monoclonal antibody which binds specifically with a Platelet Factor 4 (PP4)/heparin complex. The antibody preferentially binds to the complex relative to the binding of the antibody with either of the components alone. Methods are included for the production of the antibody and its use in the diagnosis of various diseases. The composition can be used for diagnosing heparin induced thrombocytopaenia/thrombosis, HIT/HITT: The composition can also be used for assessing the level of a polyclonal antibody that binds specifically within a bodily fluid or tissue sample. The present sequence represents a PCR primer used to amplify cDNA encoding the variable region of the heavy chain of the antibody of the invention which is referred to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                  Composition for the diagnosis and treatment of heparin induced thrombocytopenia/thrombosis, comprises an antibody that preferentially binds with a Platelet Factor 4/heparin complex.

                                                                                                                                                                                                                                                                                        The present invention relates to a human Fab fragment library. The Fab fragment library is useful for selecting an antigen-binding Fab using in vitro selection on immobilised or labelled antigen such as monoclonal Fab or polyclonal collection of Fab clones that specifically bind to MUC1. The obtained antibodies are useful as research reagents or as therapeutic products and also are important for target validation and target valuable source of functional genomics. The Fab library is a valuable source of antibodies for many different targets, and is useful to screen off-rates for a large series of the antigen specific Fabs. The present sequence is a PCR primer used to construct the Fab library of the
                                                                                                                                                                                                                                   Phage display libraries of human Fab fragments useful for isolating high-affinity antibodies against specific target comprises polynucleotides encoding CDR containing domains of heavy chain and light chain genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                          The present invention relates to a human Fab fragment library. The Fab fragment library is useful for selecting an antigen-binding Fab using in vitro selection on immobilised or labelled antigen such as monoclonal Fab or polyclonal collection of Fab clones that specifically bind to MUC1. The obtained antibodies are useful as research reagents or as therapeutic products and also are important for target validation and target valuable source of functional genomics. The Fab library is a valuable source of antibodies for many different targets, and is useful to screen off-rates for a large series of the antigen specific Fabs. The present sequence is a PCR primer used to construct the Fab library of the
                                                  Phage display libraries of human Fab fragments useful for isolating high-affinity antibodies against specific target comprises polynucleotides encoding CDR containing domains of heavy chain and light chain genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying toxicologically relevant canine gene to determine toxicological responses of agents, by obtaining and comparing gene expression profiles of untreated canine cells and canine cells treated with an agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

gene and the generation of an array of toxicologically relevant canine genes. The gene array is useful for obtaining a gene expression profile, by exposing a population of cells to an agent, obtaining cDNA from the population of cells, labeling the cDNA, and contacting the CDNA with the gene array. The relevant gene is useful for making and using arrays to determine toxicological responses to various agents, and also useful for identifying novel gene sequences and novel canine genes. The method for analysing toxicological responses using the canine gene array is rapid and efficient. The present sequence is related to the canine gene array
This invention relates to identifying a toxicologically relevant canine
                                                                                                                                                                                                                                                                                                                                                                                Sequence 23 BP; 4 A; 9 C; 5 G; 5 T; 0 U; 0 Other;

New zebrafish embryo cell line, which becomes a germ cell when introduced to a fish embryo, useful for making a germ line chimeric zebrafish, which is a valuable model for genetic studies of human diseases.

Example 2; Page 23; 45pp; English.

The present invention describes a fish embryo cell line, where a cell of the fish embryo cell line, after incubation in vitro for at least 24 devours, will become a germ cell when introduced to a fish embryo. Also described: (1) making the fish embryo cell line; (2) an isolated fish embryo cell line obtained by the method of (1); (3) making a germ line chimeric fish; (4) a germ line chimeric fish obtained by the method of (3); and (5) cell culture media comprising a growth factor and fish cell conditioned medium, or a growth factor and a fish cell conditioned medium, or a growth factor and a fish cell in a fish germ line chimeric fish, particularly zebrafish, which is a valuable model for genetic studies of human diseases. The present sequence represents a PCR primer for zebrafish vasa, which is used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polypeptide micro-scaffold displaying immunoglobulin complementarity determining region (CDR) 2 or CDR3 polypeptide sequences, useful for searching, selecting and screening for immunoglobulin CDR2 or CDR3 polypeptide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polypeptide micro-scaffold displaying immunoglobulin complementarity determining region (CDR) -2 or CDR3 polypeptide sequences, comprising a CDR2 or CDR3 polypeptide sequence interconnecting fragments of the adjacent framework polypeptide sequences, which are arranged to form two anti-parallel beta-strands. The polypeptide micro-scaffold and the nucleotide sequences are useful for searching, selecting and screening for immunoglobulin CDR2 or CDR3 polypeptide sequences. The present sequence is a PCR primer used for the primary amplification of human heavy chain variable region (VH)
                                                                                                                                                                                                                                                                                                                            Micro-scaffold; immunoglobulin; complementarity determining region; CDR; human; heavy chain variable region; VH; PCR; primer; 88.

The present sequence is that of a PCR primer annealing to framework region 1 of human heavy chain variable region (VH) genes. The primer was used, with an oligo-dT primer, in the amplification of a human donors as template. This provides an example of the method of human donors as template. This provides an example of the method of the invention, which relates to the cloning of immunoglobulin variable of momens (IGVD) and the construction of IGVD expression librariable method involves first strand cDNA synthesis from mRNA using a universal primer, performing second strand cDNA synthesis using a first primer capable of hybridising to a site at, or adjacent to, the 3' end of each of the IGVD sequences on the antisense strand, cleaving the double-stranded DNA with a restriction enzyme to produce double-stranded DNA encoding a functional IGVD fragment, and cloning the resulting variable
                                                                                                                                                                                                                                                                                                                                                                                                      Cloning polynucleotide sequences encoding immunoglobulin variable do (IGVD) for the manufacture of a medicament by cloning the resulting variable domain fragment sequences into a vector.

                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                        Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                     The present invention relates to a polynucleotide isolated from a Pagene and is useful for detecting a single nucleotide polymorphism i Muman gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

ö
cells that is infiltrated into lesioned tissue, and (b) acquiring bolynucleotide that encodes an antibody from the isolated B cells. The antibodies are useful for treating cancer lesions, arteriosclerosis, inflammatory disease or autolimmune disease. The present sequence was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   motife of glycine-rich repeat sequences (GRRS). Full length GRRS sequences, such as the Epstein-Barr virus strain B95.8 nuclear antigen (EBNA1) represented by AAW05704, can be used in the method of the invention is for making an antigenic protein invisible to the immune system, and consists of inserting a GRRS into the antigenic protein. The method can be used to insert a GRRS into the antigenic protein. The method can be used to insert a GRRS into
                                                                                                                                                                                                                                                                                                                                                                                                                                        Glycine-rich repeat sequence; immune system; regulatory protein; enzyme; cytokine; lymphokine; cell adhesion molecule; costimulatory molecule; drug resistance; tumour suppressant; genetic disease; viral disease; enzyme disorder; Gaucher's disease; cancer; immune system disorder; GRNS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New proteins containing GRRS which are invisible to the immune system .
used for treating cancer, immune system disorders, viral diseases, etc.

therapeutic proteins, marker genes, regulatory proteins of viral vectors, or vaccine components. The therapeutic proteins include enzymes, cytokines, lymphokines, cell adhesion molecules, costimulatory molecules, or protein products of drug resistant genes or tumour suppressor genes. The antigenic proteins or corresponding nucleic acids are used to treat genetic and viral diseases, especially enzyme disorders such as Gaucher's disease, cancer, immune system disorders and other diseases treatable by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the reasstance of a core protein to protein that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula (I(Glya)x(Glyb)x(Glyc)Zln where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence

Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula [(Glya)X(Glyb)Y(Glyc)Zln where Glya, Glyb, Glyc are 1-6 sequential Gly and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein? The products can be used for treating autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                          ..
0
unfused core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New fusion proteins resistant to proteclytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fusion protein; stabilising polypeptide; proteolytic degradation; resistance; half-life; autoimmune disease; inflammation; nitro drug; IkappaB regularor protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition; minimal motif; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pCR primers AAX26955-56 were used to identify mutations in exon 6 of the autoimmune polyendocrinopathy candidiasis ectodermal dystrophy (APECED) (also known as autoimmune polyglandular syndrome type I (APE I)) gene. The mutated and normal genes give PCR products of different sizes, the products being 285 and 225 bp, respectively. The specification describes autoimmune regulator proteins (AIR-1, AIR-2, and AIR-3). The AIR polypeptides and polynucleotides can be used in methods for the diagnosis and treatment of diseases related to immune maturation and regulation of immune response towards self and nonself. They can be used particularly
diseases, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreducease protein which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Autoimmune regulator; AIR; immune maturation; immune response; disease; autoimmune polyendocrinopathy candidiasis ectodermal dystrophy; APECED; autoimmune polyglandular syndrome type 1; APS I; PCR primer; ss.

This sequence represents a fibronectin inhibitor oligonucleotide. The invention relates to a fibronectin inhibitor protein GBP-1. The GBP-1 protein inhibits the expression of the fibronectin gene. The protein gene can be used to produce antibodies against the GBP-1 protein. The GBP-1 DNA, protein and antibody sequences can be used for the research of expression inhibition of fibronectin in relation to cell growth, cancer and cell aging
                                                                                                                                A DNA coding a protein inhibiting the expression of fibronectin geneused for research of expression inhibition of fibronectin related to cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method of amplifying and determining target mutant Ras sequences in a DNA sample, involving the use of a thermostable restriction enzyme and primers shown in AAL47773-AAL47771. The method used is designated restriction mediated selection polymerase chain reaction (REMS-PCR). The method can be used to detect H-ras, K-ras
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amplifying and determining mutant sequences in DNA sample using thermostable restriction enzyme so that during thermocycling mutant sequences are enriched while wild-type sequences and/or primer induced sites are cleaved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 K-ras; N-ras; H-ras; ras; oncogene; mutation detection; PCR; primer; probe; restriction mediated selection PCR; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a fibronectin inhibitor oligonucleotide. The invention relates to a fibronectin inhibitor protein GBP-1. The GBP-1 protein inhibits the expression of the fibronectin gene. The protein sequence can be used to produce antibodies against the GBP-1 protein. The GBP-1 DNA, protein and antibody sequences can be used for the research of expression inhibition of fibronectin in relation to cell growth, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A DNA coding a protein inhibiting the expression of fibronectin gene -used for research of expression inhibition of fibronectin related to cell growth, cancer and cell ageing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel nucleic acid containing a specific segment having at least one region that modulates expression of the VR1 (vanilloid receptor, or a functional derivative, allele crafform to this region, or a sequence that hybridises to it under standard conditions. The VR1 modulator is derived from one or more of positions 22191-223144 of GenBank AL670399, 11673-36159 of AL663116, or 4731-43231 or 36616-33151 of AP166739 and is involved in transmission of pain, particularly in primary sensory neurons. The invention also chescribes a vector that contains the VR1 modulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulating expression of the VR1 receptor by introducing the modulator or the vector into a cell that contains the VR1 gene. The modulator or the intention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded oligonucleotide fragment of it), e.g. by Western blotting or enzymetre in the binding to a regulatory sequence (or a double-stranded oligonucleotide fragment of it), e.g. by Western blotting or enzymetre from its binding site for a transcription factor, e.g. WZR1, NEARDEBS, NEAT or binding site for a transcription factor, e.g. WZR1, NEARDEBS, NEAT or CATANA. The mucleic acids of the invention, or vectors containing them, are used for prevention or treatment of pain, also for treating sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also
                                                                                                        ö

(I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly. A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.
neuralgia and myalgia, that are associated with activity of the VR1 receptor. This sequence represents a fragment of murine VR1 exon 1d DNA which is capable of binding to a transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3 end capable of forming a copyback structure, a HCV non-structural protein 58 (NS5B), ATP, GTP, CTP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is cailolabelled and an assay buffer that supports replication activity of NS5B. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of properties of an RNA template for copy-back self-priming RNA synthesis of CT to characterise the biological relevance of lead compounds. The optimal RNA templates can be used for developing a system to characterise optimal RNA templates can be used for developing a system to characterise coptimal RNA molecules to co-crystallise with HCV NSSB polymerase mechanistically and kinetically and for designing small RNA molecules to co-crystallise with HCV NSSB polymerase. The assay system of the invention is useful for detecting HCV replicase activity.

The nucleic acid synthesised by NSSB is detected by evaluating an autoradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, '(MU)4 used to direct RNA synthesis by the control of the control o
                                                                                                                                                                                                                    RNA template, (AU)4 used to direct RNA synthesis by HCV RNA polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates,

of HCV NS5B.

```
The invention relates to a replicase complex comprising a hepatitis C virus (HCV) NSSB replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not form a stable duplex in solution in the absence of the HCV NSSB protein. The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and evaluate antiviral inhibitors and to improve the specificity and cfficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV NSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mas-incorporation and investigation of mechanistic properties of NSSB replication and ultimately in the screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NSSB replication and ultimately in the development of inhibitors of NSSB. Newly identified inhibitors of ceplicase activity may be used for developing anti-HCV pharmaceuticals. Sequences ABK99271-ABK99296 represent HCV NSSB replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3' end capable of forming a copyback structure, a HCV non-structural protein 5B (NSSB), ATP, GTP, CTP, and UTP nucleoside triphosphates (WTPS), where one of the NTP is radiolabelled and an assay buffer that supports replication activity of NSSB. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds or to characterise the biological relevance of lead compounds. The coptimal RNA templates can be used for developing a system to characterise (CC NSSB polymerase mechanistically and kinetically and for designing system of the invention is useful for detecting HCV replicase activity. The nucleic acid synthesised by NSSB is detected by evaluating an autoradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, (AU) 5 used to direct RNA synthesis by RNA polymerase proteins of HCV, BNUY and polivirus. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inter-simple sequence repeat; ISSR; SSR; PCR; primer; genotyping; plant;
             RNA template, (AU)5 used to direct RNA synthesis by HCV RNA polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                          Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates.
                                                HCV replicase; non-structural protein 5B; NS5B;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.4%; Score 16.8; DB 1; Length 36; 16.7%; Pred. New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and animal systems.
                                                                                                                                                                                                                                                                                                                               The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabeters insipidus, lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary amemorrhagic tealangiacteria, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                            the receptor (FGFR)-4, that causes overexpression and/or altered activity of the receptor in calls and has cytostatic activity. The product of the invention is a receptor tyrosine kinase inhibitor. A receptor tyrosine kinase inhibitor, especially mutated FGFR-4 (kinase inactive) is useful for treatment and/or prophylaxis of over functional receptor tyrosine kinase-related conditions, especially cancer. The inhibitor can also be back to disease, particularly carcinoma, particularly through inhibition of metastasis. The inhibitor is used to treat breast cancer, squamous cell carcinoma, glioblastoma, neuroblastoma and/or uterine cancer. Detection of a mutated FGFR-4 or a sequence encoding it, can be used in differential diagnosis of cancer, or in a screening assay to determine a predisposition to developing cancer. This sequence represents a PCR primer used to amplify the FGRF-4 fragment used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  overexpression; cytostatic; receptor tyrosine kinase inhibitor; cancer; kinase inactive; treatment; prophylaxis; tyrosine kinase-related; hyperproliferation; invasion; disease; carcinoma; metastasis; detection; breast cancer; squamous cell carcinoma; glioblastoma; neuroblastoma; uterine cancer; diagnosis; screening assay; predisposition; mutant;

receptor (FGFR) - that causes overexpression and/or altered activity of the receptor in cells and has cytostatic activity. The product of the invention is a receptor tyrosine kinase inhibitor. A receptor tyrosine kinase inhibitor. A receptor tyrosine kinase inhibitor, especially mutated FGFR-4 (kinase inactive) is useful for treatment and/or prophylaxis of over functional receptor tyrosine kinase-related conditions, especially cancer. The inhibitor can also be used to treat cancer and/or hyperproliferation and/or invasion that leads back to disease, particularly carcinoma, particularly through inhibition of metastasis. The inhibitor is used to treat breast enacer, squamous cell carcinoma, glioblastoma, neuroblastoma and/or invair.
                                                                                                                                                               cell carcinoma, glioblastoma, neuroblastoma and/or uterine cancer.

Detection of a mutated FGFR-4 or a sequence encoding it, can be used in differential diagnosis of cancer, or in a screening assay to determine a predisposition to developing cancer. This sequence represents a PGR primer used to amplify the FGRF-4 fragment used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining methylation state of FMR1 gene promoter for diagnosing fragile X syndrome in males involves denaturing DNA sample, subjecting DNA to bisulfite modification, amplifying DNA and detecting products.
                                                                                                                                                                                                                                                                                                                                                    0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an El and an El protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunishing humans against HCV. The recombinant HCV El and/or El proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to in vitro monitoring from HCV infection. The present sequence is a PCR primer used in the production of vectors in the exemplification

RESULT 858

The present invention describes a novel method of diagnosing Fragile X syndrome using a PCR-based method of methylation analysis. The FWRI gene promoter. Incated at chromosome XQZ7.3, is composed of a CGG trinucleotide repeat. The expansion of this repeat leads to a premutation and then a full mutation, the latter of which is likely to cause the methylation of a nearby CGG island, causing the Fragile X syndrome phenotype. This method is useful in the design of appropriate therapies and counselling for affected individuals and carriers

Diagnosing, preventing and treating non-small cell lung cancer (NSCLC) comprises determining an expression level of an NSCLC-associated gene in
                                                                                                                                                                                                                                                                          The invention comprises an Hepatitis C virus (HCV) vaccine for reducing liver disease. The vaccine of the invention comprises an HCV B1 or E2 protein as an antigen. The HCV vaccine is useful for reducing liver disease (e.g. liver fibrosis) in a chronic HCV-infected mammal. The present DNA sequence represents a PCR primer that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of diagnosing non-small cell lung cancer (NSCLC) or a predisposition to developing NSCLC in a subject by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and animal systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties.

The liver disease is reduced by at least 1-2 points according to the overall 18hak score in the HCV-infected mammal. Also included are a method for predicting changes in liver disease in a chronic HCV-infected mammal, a therapeutic HCV vaccine composition (comprising at least one purified or a combination of at least 2 HCV single or specific oligomeric recombinant envelope protein selected from an E1 or E2 protein, a part of E1 and E2 proteins, an E1/E2 protein complex formed from purified HCV single or

determining the expression level of a NSCLC-associated gene in a biological sample derived from the subject, where an increase or decreas of the level compared to a normal control level of the gene indicates that the subject suffers from or is at risk of developing NSCLC. The method is useful in diagnosing NSCLC or a predisposition to developing NSCLC in a subject. The compound, polymoucleotide and the encoded polypeptide and composition are useful in treating or preventing NSCLC. This sequence corresponds to a primer for semi-quantitative PCR amplification of genes that are differentially expressed in NSCLC cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of hepatitis C virus (HCV) vaccine composition for reducing liver disease, serum alanine aminotransferase levels, steatosis, or anti-E2 immunoreactivity in the liver of a chronic HCV-infected mammal.

cc specific oligomeric recombinant El or E2 proteins or its parts and optionally a pharmaceutical adjuvant), a composition (comprising at least cone El or E2 peptide, and optionally, a pharmaceutical adjuvant), an immunogenic HCV composition (or HCV vaccine composition) comprising a recombinant virus allowing expression of at least one HCV recombinant convocation (selected from an E1 protein and/or an E2 protein, and their parts, and optionally, a pharmaceutical adjuvant) and an HCV vaccine composition (comprising a recombinant virus allowing expression of at least one HCV recombinant envelope protein changes from an E1 protein and/or an E2 protein, and parts of the E1 and E2 proteins and, conforming in a cuseful for reducing liver disease (such as liver fibrosis or its progression), serum ALT levels, status in a chronic HCV-infected mammal, or for treating a chronic HCV infected mammal, or for treating a chronic HCV in vitro monitoring HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a PCR primer used in the production of Glycosylation site-deleted mutants of the HCV P1 proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of human ATP dependent membrane conjugated zinc proteinase 10.45. The sequences can be used in the treatment of developmental disturbances and lipid metabolism disease. The present sequence is a PCR primer for the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide-human ATP dependent membrane conjugated zinc proteinase 10.45 and polynucleotide for encoding such polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ATP dependent membrane conjugated zinc proteinase 10.45; enzyme; development disturbance; lipid metabolism disease; gene therapy; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ATP dependent membrane conjugated zinc proteinase 10-45 PCR primer #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Arrow A,
RESULT 864
AAV21967
                                                                                                 The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mool DNA fragments of between 250 and 500
by with an (AC15 and a (TC15 oligonuclectide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
cross-fication and indexed herein (see below). The sequence upstream and
specification and indexed herein (see below). The sequences upstream and
commercem of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
crequired PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait losi, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant oligonucleotides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. The methods are particularly used in immuno-compromised individuals (e.g. Cram-positive with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or fused to, antiviral or other antimicrobial oligonucleotides. Apart from theraptory cultures, foods, beverages and industrial processes The coligonucleotides are specific for bacteria, without affecting metabolism in mammalian cells. They may also activate RNase H and have a general, non-specific immune-stimulating effect. The oligonucleotides can be administered orally, intranasally, rectally, topically or by injection, optionally coupled to an agent (e.g. carbohydrate or polyamine) that

This antisense oligonuclectide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant comprises administration of such nuclease resistant.

The treatment comprises administration of such nuclease resistant oligonuclectides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonuclectide can be covalently linked to an antibiotic. The methods are particularly used in immuno-compromised individuals (e.g. parients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or tuesed to, antiviral or other antimicrobial oligonuclectides. Apart from the oligonucleotides can be used to control bacteria in laboratory cultures, foods, beverages and industrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism in mammalian calls. They may also activate Rnase H and have a general, in mammalian calls. They may also activate Rnase H and have a general, in mammalian calls. They may also activate Rnase H and have a general, one-specific immune-stimulating effect. The oligonucleotides can be administered orally, intransabally, rectally, topically or by injection, or prionally coupled to an agent (e.g. carbohydrate or polyamine) that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics.
                                                                      Nuclease resistant antisense oligo NBT 140 targeted against (AT)9.

A method has been developed for labelling an oligonuclectide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to 3' exonuclease activity. The method can be used for detecting a generated and extended using a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from (i) a nucleotide sequence (CG)xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a nucleotide sequence (CG)xRK, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR, where R is a purine selected from adenine and guanine and X = 6-16, (vii) a nucleotide sequence (CA)xRR, where R is a purine selected from adenine and suracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR, where R is a purine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR, where R is a purine selected from cytosine, thymine, and uracil.
                      A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and typosine, and n is an integer of 1 or more ) at the 3-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5 to 3' exonuclease activity. The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer, quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; ss.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparising genomic DNA from through energy and genomic DNA from through and genomic DNA from through and genomic DNA from normal cells. The method involves the cells from the same individual comparison pair comprising genomic DNA from through and genomic DNA (G)xRG, where R is as in (1) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRY, where R is as in (1) and Y is a nucleotide sequence (CG)xRY, where R is as in (1) and x = 3-7, (iv) a nucleotide sequence (CG)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRY, where R is a purine selected from admine and Y is a pyrimidine selected from denine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from cytosine, where R is a purine selected from admine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from of the primers. The method is useful from deriving senociated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                             ö
from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; ss.

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, coln and rectum cancer, connective tissue cancer, oesophagaal cancer, elective cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, overian cancer, prostate cancer, rhabdomyosarcoma, skin cancer, stomach cancer, besticular cancer, rhabdomyosarcoma, skin cancer, stomach cancer, besticular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNR. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.

The present sequence is an immunostimulatory oligonucleotide described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larymx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-
                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of developing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOUS; Rep-X; human; genetic disease; drug-treatment; Machado-Joseph; Haw River syndrome; Huntington's disease; fragile-X syndrome; Predreich's ataxis; myotonic dystrophy; hyperandrogenaemia; spinal atrophy; bulbar atrophy; spinocerebellar ataxia.

```
comprises detecting tangence to twenthing a dataset comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in useful for identifying and detecting candidate polymorphic repeats in the use of the seases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syntome, Huntingron's disease, fragile-X syndrome, Predistorby, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                for

The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease astates. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening; esentic engineering; pharmacogenomic; gene mapping; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbetage gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases include autoimmune diseases, degenerative nervous system diseases.

Coraft versus host disease. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases, infectious disease, atrophic gastritis Degenerative nervous system diseases include multiple of clerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as those present in Coodpasture's syndrome and Type IV hypersensitivities such as those force and the veast genue Candida, parasitic infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoprofiferative diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of MAPK genes in cells, tissue explants or organisms by introduction of SINA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) ectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidabetic, antiminamatory.

The antiathmatic, immunosuppressive, antibacterial, antirheumatic, antisposiatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I can in a wide range of tumours, and inflammatory diseases asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease. They can also be used for drug screening; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK sinA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present invention describes a short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             short interfering nucleic acid, useful e.g. for treatment and mosis of cancer, downregulates expression of mitogen-activated

```
that downregulates expression of a mitogen-activated protein kinase that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs aver cytostatic, anoractic, antibacterial, antihalammatory, antiathmatic, antipsoriatic and gastrointestinal activities. The MAPK antistrict, antipsoriatic and gastrointestinal activities. The MAPK antister explants or organisms, e.g. for treating obesity; diabetes types in sinks can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types and il; a wide range of tumours, and inflammatory diseases (asthma, espetic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; pharmacogenomics; cidentification, mand validation; genetic engineering; pharmacogenomics;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; vascular endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiathritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence represents a MAPK sinA which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          le-nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human VEGFR1 short interfering nucleic acid (siNA) SEQ ID NO:390

Human VEGFR1 short interfering nucleic acid (siNA) SEQ ID NO:817

(first entry)

12-FEB-2004

```
The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (WEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiangiogenic, cytostatic, antidiabetic, or poptrates. The siNAs are potentially gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis—associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, studying gene function, and also for gene mapping (e.g. of single-mucleotide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a cin that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianajogenic, cytostatic, nephrotropic and gynaecological activities. The siNA are useful for modulating commanded single the expression of VEGFR genes. The siNA are potentially downregulating) the expression of VEGFR genes. The siNA are potentially cureful for treating a wide range of angiogenessis-associated conditions, particularly cancers, diabetic relinopathy, macular degeneration, particularly cancers, diabetic relinopathy, macular degeneration, consumptivity dispersive vident dispersive single dentification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-incleant sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A siNA of the invention has cytostatic, immunosuppressive, virucide, and anti-HFV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of sing represent siNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer or autoimmune disease, downregulates expression of the BCL2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.4%; Score 16.4; DB 1; Length 19; 94.4%; Pred. ```
The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A sulf A feet invention has cytostatic, immunosupressive, virucide, and anti-HIV activity. The SINA are useful for modulate succession or activity of BCL2 by RNA interference. SiNA are used to expression or activity of BCL2 by RNA interference. SiNA are used to organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, traget infentification and validation, general expineering, pharmacogenomics, studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The sequences shown in ADF49273-ADF50143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present sequence is an exon 8 primer for the polymerase chain reaction-single stranded conformational polymorphism (PCR-SSCP) analysis of the endothelial nitrogen monoxide synthase (eNOS) gene. The PCR-SSCP analysis was used in an example of genetic screening method for diseases associated with coronary arterial spasm, which comprises determining if 1 or more specific nucleotides in the eNOS gene have been substituted, specifically G894T, C774T, T(-786)C, A(-922)G and T(-1468)A. Screening for diseases associated with coronary spasm, e.g angina pectoris, cannot be easily carried out by existing methods, this method allows rapid and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human nucleolin phosphorothioate antisense oligonucleotide, SEQ ID NO:42.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3 -directed cDNA libraries prepared from various human tissues; synchesis of CDNA was initiated from the 3 -end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of disgnosing abnormal cell function or for recognising different cell types. The primers T41101-2 amplify clone pm2619 which comprises the GS HUMGS001562 (T20562), located on chromosome 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exon 8; PCR primer; single stranded conformational polymorphism; SSCP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequences AAC92560-C92639 represent antisense oligonucleotides targetted to the human nucleolin gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human nucleolin mRNA, and were analysed for their effect on nucleolin mRNA in the nucleolin mRNA is a levels by quantitative real-time PCR. Nucleolin (also known as P92 or C23) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome biogenesis and cells. Nucleolin primarily participates in ribosome biogenesis and cells. The nucleolar via a ribonucleoprotein consensus sequence. Thosomes in the nucleolus via a ribonucleoprotein consensus sequence. However, it has also been shown to be involved in cytokinesis, nucleogenesis, cell proliferation and growth, transcriptional repression, replication, signal transduction, and chromatin decondensation. Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar ciposes, and whose expression is associated with the prediction of tumour growth rate. The presence of antibodies against nucleolin are associated with systemic connective tissue diseases such as systemic lupus erythemacrosus (SLE) and selexodermalike chronic graft versus host disease. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with nucleolin
                                                                                                               Novel antisense compound targeted to human nucleolin which specifically hybridizes with and inhibits the expression of human nucleolin, useful for modulating the expression of nucleolin in cells.
                                                                                                                                                                                                                               Claim 14; Col 41-42; 41pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a compound 8-50 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding kinase suppressor of ras-1 (KRR), and inhibits the expression of KSR. Also described: (1) a compound 8-50 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of an ancies and anolecule encoding KSR; (2) a composition comprising the compound and a carrier or diluent; (2) a composition comprising the compound and a carrier or diluent; (2) a composition comprises with the compound and acarrier or diluent; (3) to inhibiting the expression of KSR in cells or tissues by contacting the calls or tissues by the the compound so that expression of KSR is inhibited; and (4) treating an animal having a disease or condition associated with KSR by administering to the animal a therapeutic or prophylactic compound has cytostatic activity and can be used as a KSR inhibitor, and in antisense gene therapy. The compound, composition and methods are in antisense gene therapy. The compound, composition and methods are byperproliferative or developmental disorder, or a disease or condition arising from aberrant apoptosis by inhibiting the expression of KSR. They are also useful in research and diagnostics for modulating the expression of KSR. They are also useful in research and diagnostics for modulating the expression of KSR. They are also useful in research and diagnostics for modulating the expression of KSR. They are also or condition and methods are an early sequence represents a chimeric phosphorothicate
                                                                                                                                                Human; kinase suppressor of ras-1; KSR; cytostatic; KSR inhibitor; antisense gene therapy; hyperproliferative disorder; phosphorothioate; developmental disorder; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel antisense oligonucleotides (ACC71728-ACC71750 and ACC80101-ACC80155) targeted to Vascular Endothelial Growth Factor Receptor-2 (VEGFR-2) nucleotide sequence, and which inhibit the expression of VEGFR-2. The oligonucleotides are useful in compositions for treating a disease or condition associated with VEGFR-2, such as hyperproliferative disorder, e.g. cancer, a disease or condition involving angiogenesis, or rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding vascular endothelial growth factor receptor-2 (VEGFR-2), useful for treating a disease/condition associated with VEGFR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothicate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length. Also all

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymocleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polynucleotide useful for detecting single nucleotide polymorphisms

RESULT 888
ADF87844/c
```

an isolated nucleic acid probe or primer comprising at least 8 configuous nucleotides of the nucleic acid, an isolated antisense nucleic acid, didentifying an AbAM or interactor gene ligand and an isolated nucleic acid variant of Gene 803, 845, 847, 874 or 962. The nucleic acid or alternate splice variants, methods, kits and antibody/antibody fragment are useful for diagnosing and treating an ADAM or interactor geneassociated disorder, e.g. asthma, atopy, obesity or inflammatory bowel disease. The present sequence is an SSCP (single-strand conformation polymorphism) primer used to analyse the above genes for the presence of ô Gaps ö Score 16.4; DB 1; Length 20; Pred. The invention relates to an isolated nucleic acid or alternate splice variant comprising a nuclectide sequence containing at least one of the cangle in the nuclectide polymorphisms given in the specification, a nuclectide sequence having at least 15 contiguous nuclectides of them, or complements of them. The genes are ADAM19 (a disintegrin and metalloprotease 19, also known as gene 845), NRG2 (neuroregulin 2, also known as gene 845), NRG2 (neuroregulin 2, also known as gene 845), NRG2 (neuroregulin 2, also known as gene 861) and ADAM752 (a disintegrin and metalloprotease with thrombospondin typel motif 2, also known as gene 874), endophilin 2 are a vector comprising the isolated nucleic acid (or alternate splice with thrombospondin typel motif 2, also known as gene 871), and nucleic acid (or alternate splice variant), a host cell containing the vector, an isolated polypeptide or antibody or antibody reagment that binds to the polypeptide.

Contained by the novel nucleic acid (or alternate splice variant, vector, polypeptide or antibody, and a carrier, plant or alternate splice variant binds to the polypeptide.

Contained at least one component to detect the hybridisation of the variant or the binding of the antibody to an ADAM gene mucleotide sequence (comprising the metalloprotease (ADAM) gene nucleotide sequence (comprising the antibody or antibody to the interactor gene amino acid sequence), a kit of detecting an interactor gene amino acid sequence), and the binding of the antibody to the interactor gene amino acid sequence), and indiagody to the interactor gene amino acid sequence), and respiratory disorder in a human subject, determining an ADAM or interactor gene pharmacogenetic profile in a human subject, identifying an orthologue of a human ADAM or interactor gene amino acid sequence.

Confidence of a human ADAM or interactor gene amino acid sequence comprises an introduced null mutation in an endogenous genice comprises an introduced null mutation in an endogenous sequence comprises an introduced null ADAWTS2; a disintegrin and metalloprotease; neuroregulin 2; SNP; single nuclectide polymorphism; a disintegrin and metalloprotease with thrombospondin typel motif 2; asthma; atopy; obesity; inflammatory bowel disease; respiratory disorder; single-strand conformation polymorphism. New isolated nucleic acid or alternate splice variant, useful for diagnosing and treating a disintegrin and metalloprotease (ADAM) or interactor gene-associated disorder, e.g. asthma, atopy, obesity or Del Mastro RG; Dupuis J, Little RD, Van Eerdewegh P, Claim 2; Page 124; 338pp; English. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                          Gaps

The human mpGES-1 gene is located on chromosome 9, more specifically to 9d34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiated can ophthalmological, immunomodulatory and cardiovascular activities, cand can ophthalmological, immunomodulatory and cardiovascular activities, and candidona.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ischaemia or reperfusion injury, or lar or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a day accord cell comprises: (a) obtaining the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its. Genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction containing. Sequences AAZI7803-Z18342 represent primers that can be used gene family. Sequences AAZI7803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, characteristic and the property of the pattern of gene expression. The containing cells capable of the pattern of gene expression. The containing cells capable of the pattern of gene expression. The containing cells capable of the pattern of gene expression. The containing cells capable of the pattern of gene expression. The containing cells capable of the pattern of gene expression and the containing cells capable of the containing cells capable of the capable of the pattern of gene expression. The containing cells capable of the capab

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the condividual, e.g. a fecus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AA17803-21842 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene family can be selected from a set of homeobox genes, kinase genes,

                                                                                                                                                                                                                                                                                                                                                                    Vider B;
 The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AA217803-218342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell the pattern cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its constitute, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the crimic status, whether it carries a genetic defect, or whether it is considered. They can also be used for a individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired considering the pattern of gene expression in a selected considered from a set of homeobox genes that can be used con the family. Sequences AAZ17803-Z18342 represent primers that can be used con the family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor considering upperfamily genes or cadherin superfamily genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell; its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired cobtaining cells capable of expressing an homeobox related desired (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences ARZH303-ZH3942 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The genes, kinase genes, Gaps ; 0 gene family can be selected from a set of homeobox genes, kinar protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes Score 16.4, DB 1; Length 21; Pred. New ABC1 polypeptide is useful for treating diseases associated with ABC1 biological activity, e.g. Alzheimer's disease, Huntington's disease and

Example; Fig 11; 229pp; English

The invention relates to the human ABC1 cholesterol transporter protein (B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is a member of the ATP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in Cholesterol transport, particularly intracellular cholesterol efflux from the cell. The gene encoding ABC1 is involved in cholesterol efflux from the cell. The gene encoding ABC1 is corated on chromosome 9431, and mutations in this gene are associated with two genetic HDL (high density lipoprotein) deficiency (FHA). These diseases of the standinable in that TD is an autosomal recessive disorder, while FHA is inherited as an autosomal adminant trait. Low levels of HDL ("good cholesterol") in the blood correlate with a high risk of cardiovascular cisease, particularly coronary artery disease, but also cerbrovascular disease. Coronary restenois, and peripheral vascular disease compounds for the treatment or prevention of cardiovascular disease compounds which minmic ABC1 activity, compounds which minmic ABC1 activity, compounds which attended to encompasses compounds which minmic ABC1 activity, compounds which attended to restend to the invention of cardiovascular disease, especially coronary artery disease, coronary restenois or peripheral vascular disease, coronary restenois or peripheral vascular disease, coronary restenois or peripheral vascular disease. The proteins and nucleotides can be used to treat or prevent cardiovascular disease, especially coronary artery disease, coronary restenois or peripheral vascular disease, coronary restenois or peripheral vascular disease, coronary restenois or peripheral vascular disease, coronary restenois or peripheral values and disease. They may also be used in the treatment of diseases associated disease. The invention specifically excludes proteins with the exact amino acid sequences of GenBank Accession No: CAA10005.1 and X75956, and the nucleic acid with the exact sequence as GenBank Accession No: AJ012376.1. The present sequence represents a polymorphic site of the human ABC1 gene disease, Huntington's disease, X-linked adrenoleukodystrophy and cancer.

The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                              Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR- or RXR-mediated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74205-A74322). SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant breeding programmes. The present sequence is a PCR primer used for detecting the presence of a SSR locus in a pine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding program.
                                                                                                                                                                                                                                                                              PCR primer; loblolly pine; Simple Sequence Repeat; SSR; microsatellite DNA repeat; genetic marker; mapping; inheritance study; population genetics study; plant breeding programme; ss.

The invention relates to a method of treating a vascular inflammatory pathology in a human, comprising administering a single or divided 0.5-15 mg/kg dose at least once every 1-6 weeks of an anti-tumour necrosis factor (TMF) chimeric antibody which competitively inhibits binding of TNF to monoclonal antibody CA2. The invention is used to treat a vascular inflammatory pathology particularly Kawasaki's pathology or disseminated intravascular coagulation or atheroselerosis. The present sequence represents DNA encoding the pLC671 partial sequence with insert #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rheumatoid arthritis; systemic lupus erythematosus; diabetes mellitus; angiogenesis; autoimmune pathology; graft versus host disease; cachexia; scleroderma; infection; circulatory collapse; inflammatory disease; inflammatory bowel disease; neurodegenerative disease; sepsis syndrome; Crohn's disease; ulcerative collitis; multiple sclerosis; angiogenesis; lymbhoma; infantile haemangioma; alcohol-induced hepatitis; cytostatic; ocular neovascularisation; alcohol-induced hepatitis; cytostatic; immunosuppressive; neuroprotective; hepatotropic; antiangiogenic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 joint inflammation; tumour necrosis factor; TNF; joint stiffness;
                                                                                                                                                                                                                                                                                                        Treating a vascular inflammatory pathology, e.g. Kawasaki's pathology, comprises administering an anti-Tumor Necrosis Factor (TNF) chimeric antibody which competitively inhibits binding of TNF to a monoclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 16.4; DB 1; Length 21; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                            single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                         New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing.

humans. The method involves administering an anti-tumour necrosis factor (TMF) chimeric antibody or its fragment, which competitively inhibits conformed involves administering an anti-tumour necrosis factor (TMF) chimeric antibody or its fragment, which competitively inhibits binding of TNF to monoclonal antibody CA2. The anti-TNF antibodies are useful for treating joint inflammation or joint stiffness associated with creating to treat angiogenesis, such as in the treatment of a VEGF-mediated disease or to treat TNF-related pathologies such as acute and chronic cutcimmune pathologies (e.g. graft versus host disease, diabetes mellitus or solestoderma, infections (e.g. sepsis syndrome, cachexia or circulatory collapse), inflammatory disease (e.g. ulcerative colltis, inflammatory disease), neurodegenerative disease (e.g. bowel disease), antipipe sclerosis, Huntington's disease or Alzheimer's disease), multiple sclerosis, Huntington's disease or Alzheimer's disease), maltignant pathologies (e.g. lymphoma, infantile haemangioma or cancerralated angiogenesis (e.g. lymphoma, infantile haemangioma or cancerralated congiogenesis (e.g. ocular neovascularisation). The present sequence is pLG871 plasmid partial DNA fragment used in the careful construction of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of anti-tumor necrosis factor (TNF) chimeric antibody for treating e.g. joint inflammation or joint stiffness, infections, inflammatory diseases, neurodegenerative disease, or malignant pathologies.

```

```
The present invention relates to a method of treating ulcerative colitis in a human in need. The method involves administering a tumour necrosis factor (TNF)-inhibiting amount of an anti-TNF chimeric antibody that competitively inhibits binding of TNF to monoclonal antibody CA2. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating human ulcerative colitis by administration of a tumor necrosis factor (TNF)-inhibiting amount of an anti-TNF chimeric antibody that competitively inhibits binding of TNF to monoclonal antibody CA2.

The method is useful in treating psoriatic arthritis. The present sequence represents the
methods and compositions are useful for treating ulcerative colitis in humans. The present sequence is pLC871 plasmid partial DNA fragment used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to anti-human tumour necrosis factor (TNF)-alpha antibodies, peptides and their encoding nucleic acids. The invention is useful in pharmaceutical and diagnostic compositions and production and in treating TNF-mediated pathologies. The present sequence is pLC671 vector peptide encoding DNA used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-idiotypic antibodies that bind specifically to chimeric or humanized antibodies that binds to human Tumor Necrosis Factor (TNF)alpha, useful for detecting TNFalpha in samples and for diagnosing TNFalpha mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit can engiquenesis. Specifically, it refers to siRNAs that target and cause candidacenesis. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (FIL-1) and the FIk-1/KDR (kinase domain certain) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and condition the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic agent is useful for treating disease associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, agence related macular degeneration, inflammatory disease, psoriasis and remanated arthritis. Furthermore, it can be used to treat various cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antidiabetic, antidiabetic, antidiathetic activities. This oligonuclectide is a human FIk-1/KDR DNA coligo, a target for siRNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic

This invention describes a novel potassium channel protein (1) Kv6.2. This protein forms, with the protein Kv2.1, voltage-dependent potassium channels that are expressed preferentially in the myocardium and hippocampus and have high affinity for propafenone. The channels are used to identify specific modulators which are potentially useful as therapeutic agents, particularly as class IC anti-arrhythmics, but more generally agents for treating cardiovascular or nervous system diseases, e.g. antihypertensives or cardioprotectants, or for treating learning and memory disorders or neurodegenerative disorders such as epilepsy, ischemia, stroke, or Parkinson's or Alzheimer's diseases. Nucleic acid that encodes (1) is used for recombinant production of (1), particularly to generate cells for drug screening. (1) is also used to raise specific antibodies. This sequence encodes a fragment of the human Kv6.2 protein
                                                                                                                                                                                                                                                                 propafenone; voltage-dependent potassium channel; therapy; treatment; class IC anti-arrhythmic; cardiovascular disease; nervous system disease; antihypertensive; cardioprotectant; learning disorder; memory disorder; neurodegenerative disorder; epilepsy; ischemia; Parkinson's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                 Kv6.2; potassium channel protein; Kv2.1; myocardium; hippocampus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New potassium channel protein, Kv6.2, used to screen for specific modulators, potentially useful e.g. as antiarrhythmic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

AAQ88807 was used in combination with AAQ88808 as primers for the PCR amplification of BoPCaR I, bovine parathyroid calcium receptor, which was used to test the effectiveness of new calci-mimetics that mimics the rection of extracellular Ca ions. These calci-mimetics can be used in the treatment of a variety of diseases associated with abnormal levels of Ca in calls, blood and plasma, specifically hyperparathyroidism. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 915 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide ragments from any one of 1220 fully defined sequences as given in specification, a labelling probe containing the SNP containing only on a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymocleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BoPCaR I; bovine parathyroid calcium receptor; hyperparathyroidism; ss

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Example 1; Page 17; 31pp; English.

an epitope specifically bound by an antibody expressed by a clone such as clone \$25, C25, C39, IC6 and clone IF3, where the antibody binds to and entralises botulinum neurotoxin type A (BONT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H c fragment and making an anti-BONT/A antibody that neutralises BONT/A (by contacting several antibodies with an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BONT/A, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (Heavy chain variable region complementarity determining region) and with a The invention relates to an isolated antibody that specifically binds to

Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of WPI; 2003-268322/26.

Claim 1; Page 258; 455pp; English.

coxicity

The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also described: (1) an array comprising one or more polynucleotides selected from the genes corresponding to the partial sequences given in AB282842 to AB284764, or their fragments of at least 20 nucleotides, or homologues is and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic parameceutical or industrial agent, comprising: (a) exposing cells to an agent or isolating cells from a human subject who was exposed to an agent; (b) obtaining the test gene expression profile

```
The invention relates to a novel method for identifying a B cell carrying a surface immunoglobulin (Ig) molecule having a binding site for an a surface immunoglobulin (Ig) molecule having a binding site for an tiggen of interest. The method comprises contacting a sample putatively containing the B cell with the antigen of interest and with a receptor specifically binding to the Ig molecule, and assessing the presence of the detectable signal. The invention further comprises: an antibody comprising an amino acid(B) sequence(B) given in the specification, and/or are encoded by a nucleic acid sequence(B) also given in the specification, and a device for assessing the presence of a detectable signal defined above, where the device comprises a closed system for the detection laser-beam and a catcher tube, and where the B cell of interest can be collected as a single cell by means of an electrochemical device, which is triggered by an electric signal generated by the fluorescence activated cell sorter (FACS) device, where the electrochemical device
for a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of that gene after exposure to other known toxic compounds. The methods are useful for exposure to other known toxic compounds. The seponess on a cellular, organ or system level. The arrays comprising the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a B cell carrying a surface immunoglobulin molecule having a binding site for an antigen of interest, useful for constructing therapeutic antibodies, comprises contacting a sample with the antigen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method for identifying a B cell carrying a surface immunoglobulin (1g) molecule having a binding site for an antigen of interest. The method comprises contacting a sample putatively containing the B cell with the antigen of interest and with a receptor specifically binding to the Ig molecule, and assessing the presence of effectable signal. The invention further comprises: an antibody generated by the method above which is specific for human CD28 or comprising an amino acid(s) sequence(s) given in the specification, and/or are encoded by a nucleic acid sequence(s) also given in the specification; and a device for assessing the presence of a detectable signal defined above, where the device comprises a closed system for the detection laser-beam and a catcher tube, and where the B cell of interest
moves the nozzle of the steady catcher tube liquid stream for a programmed time over a collecting tube, microtiter plate or other container after a B cell is sorted. The method is useful for identifying a B cell carrying a surface Ig molecule having a binding site for an antigen of interest. The method is also useful for cloning of antibody variable regions from the identified B cells, which may subsequently be employed in the construction of proteins such as antibodies or its fragments or derivatives useful in therapeutic approaches. The method is useful as an alternative to phage display for the gain of antibodies or its its fragments. This polynucleotide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ಹ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying a B cell carrying a surface immunoglobulin molecule having binding site for an antigen of interest, useful for constructing therapeutic antibodies, comprises contacting a sample with the antigen

```
which is triggered by an electric signal generated by the fluorescence activated cell sorter (FACS) device, where the electrochemical device moves the nozzle of the steady catcher tube liquid stream for a programmed time over a collecting tube, microtiter plate or other container after a B cell is sorted. The method is useful for identifying a B cell carrying a surface Ig molecule having a binding site for an entigen of interest. The method is also useful for cloning of antibody variable regions from the identified B cells, which may subsequently be employed in the construction of proteins such as antibodies or its fragments or derivatives useful in therapeutic approaches. The method is useful as an alternative to phage display for the gain of antibodies or its its fragments. This polynucleotide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New tyrosine kinase receptor protein related to FGF receptor proteins - and corresponding DNA sequences, used in treatment and diagnosis of lung

Methods for suppressing corneal cell growth include administering Ca ions to the cells. The methods are used for the treatment of corneal tissue injury following accidental injury, ocular surgery or due to corneal disorders caused by abnormal healing processes of the corneal epithelium and endothelium. The methods are based on the discovery that corneal tissue can express mRNA for HGF, KGF and their respective receptors. The discovery was shown by PCR amplification using the primers AAT63273-87. Primers AAT63277-8 were used to amplify a 342 bp fragment of the HGF receptor CDNA. This primer is the upstream amplification primer and corresponds to bases 3993-4013 of the HGF receptor gene. The amplified fragment was detected using probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Promoting or suppressing corneal cell proliferation - using hepatocyte growth factor or calcium ions resp., e.g. for treating corneal injury or for preserving corneal tissue prior to transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present sequence was used in the development of a novel method for the inhibition of corneal epithelial cell differentiation. The method comprises contacting the cells with a hepatocyte growth factor (HGF) and/or keratinocyte growth factor (KGF). When HGF and KGF are both used, the cells can be contacted with them sequentially or simultaneously. The HGF and/or KGF is in a timed release delivery system, especially comprising biodegradable polymer microcapsules. The HGF and/or KGF are administered topically. The method is used for treating dry eye,
                                                                                                                                                                                                                                                Inhibition of corneal cell differentiation - by using hepatocyte growth factor and/or keratinocyte growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HSV-1; latency associated transcript; LAT; LATin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This PCR primer was used to amplify reverse transcribed cDNA which encodes a protein that is associated with liver neoplastic diseases, such as cirrhosis and hepetocellular carcinoma. This cDNA was obtained by reverse transcription of mRNA extracted from liver samples obtained from liver biopsy patients. The protein is not found in normal non-neoplastic livers, and its presence can therefore be used for diagnostic purposes. Antibodies to this protein have been produced and are expected to have some use in diagnosis, by detecting the presence or absence of the protein using, e.g BLISA assays. The antibodies may also be used in the protein using and treatment of liver neoplastic diseases. The invention also includes antisense oligonucleotides, and DNA sequences encoding antisense oligonucleotides, and DNA sequences encoding antisense neoplastic diseases, by inhibiting disease development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibition, corneal epithelial cell; differentiation, treatment, hepatocyte growth factor, HGF; keratinocyte growth factor; KGF; dry eye; keratoconjunctivitis sicca; PCR primer; receptor; ss.

This sequence represents a PCR primer for DNA encoding a human antiFC epsilon RI alpha chain antibody, produced using the method of the invention. The method is for preparing an antibody Pab fragment using the yeast Pichia pastoris as the host call. The method can prepare an antibody Fab fragment cost efficiently and in high yield
                                           This is the nucleotide sequence of primer Exon 2n, which was used with primer Exon 1 (see AAV64912) in RT-PCR to characterise the splice junctions of the latency associated transcript (LAT) of herpes simplex virus type 1 (see AAV64883-86). The invention relates to methods of stabilising unstable gene transcripts. A claimed polynucleotide comprises: a polynucleotide encoding a gene product; a 5'-sequence of an intron, including the splice donor and splice acceptor sites (see AAV64885-86), and a 3'-sequence of the same intron, including a hairpin structure (see AAV64887) next to the intron's branchpoint. A preferred intron is the 2.0 kb LAT of a herpes virus. Methods and compositions
                                                                                                                                                                                                                                  using the polynucleotide can be used in gene therapy and more generally as research reagents, markers of gene production, in therapeutic or diagnostic compositions, in drug screening and to identify transcripts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AntiFc epsilon RI alpha chain antibody; antibody production; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer for antifc epsilon RI alpha chain antibody coding sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    malignancy-associated gene (MAG) proteins. The polypeptide is useful for detecting antibodies associated with liver disease. Probes derived from the MAG gene are useful for detecting the presence of sequences associated with neoplastic disease, e.g. liver diseases such as cirrhosis and hepatocellular carcinoma, and therefore can be used in disease and hepatocellular carcinoma, the development of therapeutics that are useful for inhibition of the development of neoplastic liver disease. PCR primers AAX81822-23 were used in the course of the invention

The present invention describes the a method for screening potential inhibitors of the expression of the Pax4 gene by contacting the potential inhibitor with parcreatic beta cells and measuring the expression of the gene in these cells is new. Substances identified by the screening method potentiate the expression of the Pax4 gene in pancreatic beta cells and accelerate the expression of insulin gene in those cells. The method can be used in the treatment of disorders in which the exhaustion of pancreatic beta cells is involved, such as diabetes. The present sequence represents a PCR primer which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiinflamatory; antiulcer; cytostatic; antipsoriatic; antiparkinsonian; noutoropic; neuroprotective; vasotropic; chemotaxic; angiogenic; neuroprotective; vasotropic; chemotaxic; angiogenic; antiarthritic; antiarthritic; antiarthritic; antirhumatic; antiarthritic; antiarthritic; antirhumatic; thrombolytic; immunomodulator; enterocolitis; Collinger-Ellison syndrome; gastrointestinal ulceration; psoriasis; cancer; Parkinson's disease; Alzhaimer's; ALS, neuropathy; dermal scarring; wound healing; nerve repair; thrombosis; bone; cartilage formation; angiogenesis; atherostoid arthritis; multiple scalerosis; inflammatory disorder; atherosclerosis; cardiac injury; infertility; premature aging; AlDS; diabetes; stroke; gene therapy; transgenic; PRO; human; ss; primer; PCR.

The polypeptides and polyucclectides of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Bilson syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarring and wound healing, nerve repair, thromboals, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple sclerosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, AIDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the PCR primer of the invention which was used to analyse the human PRO DNA of
                                                                                                                                                                                                Novel nucleic acids encoding secreted and transmembrane polypeptides with homology, e.g. to growth and cancer-associated antigens.
                                                                                                                                                                                                                                                                                    The invention relates to a novel nucleic acid encoding a PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining genetic risk of arteriosclerosis, for clinical diagnosis, comprises hybridizing patient nucleic acid with an array of probes

mutations; (ii) applying probes from these sequences, or their complements, to a carrier; (iii) hybridising the probes with a mucleic acid from (or synthesised from) a patient sample; and (iv) detecting and evaluating the hybridisation pattern. The method provides a quick, inexpensive and informative diagnosis, and makes possible a multifactorial analysis for detecting e.g. synergism between different mutations or mutations that when present alone carry no risk but are risk associated in presence of other mutations. The results may be combined with known risk sasessement methods to provide a more reliable diagnosis, especially important with new therapeutic methods (e.g. gene therapy) that are directed against specific genes. All relevant mutations in a reference can be screened for in a single test and the method is well suited to automation. ABX09147-ABX09676 represent probes used to illustrate the method of the invention
                                                                                                        This invention describes a novel method for determining the genetic risk of arteriosclerosis both for clinical diagnosis and for population studies. The method comprises: (1) selecting risk-associated reference nucleic acid sequences, including their functionally characterizing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Substance specific to PD-1, selectively recognizing PD-1 and a related cell membrane protein, applicable in developing remedies or preventives

```
The invention relates to a substance comprising a substance recognising

CD The call membrane where PD-1 is expressed, and a linker. Also included is

CD the cell membrane where PD-1 is expressed, and a linker. Also included is

CD a drug composition containing an effective dose of a remedy and/or

CD preventive for PD-1 related disease namely immunopathy, e.g.

CD preventive for PD-1 related disease namely immunopathy, e.g.

CD preventive for PD-1 related disease, manchy immunopathy, e.g.

CD preventive for PD-1 related disease, manchy immunopathy, e.g.

CD preventive for PD-1 related disease, manchy immunopathy, e.g.

CD preventive for PD-1 related disease, manchadon-Oseph disease, anyotrophic

CD lateral sclerosis, and Creutzfeldt-Jakob disease, and autoimmune

CD diseases, e.g. glomerulorephritis, arthritis, mycardiopathy-like

CD diseases, ulcerative colitis, Sjogren's syndrome, Crohn's disease,

CD systemic erythematosus, multiple myosititis, skin toughening, rheumatic

CD erver, insulin-dependent diabetes, Behcet's disease,

CD eriarteritis nodosa, and leukoderm vulgaris. A chimaeric protein of the

CD entito was created comprising the light and heavy chains of the mouse

CD existent the hamster 145-2C11. The present sequence is a PCR primer used to

CD amplify the hamster 145-2C11 cDNA sequence
for diseases caused by immunopathy e.g. autoimmune diseases

Analyzing mutations of a target nucleic acid by detecting heteroduplexes from generated duplexes, useful for diagnosing patients affected with polycystic kidney disease.

Disclosure; SEQ ID NO 108; 126pp; English.

one first The invention relates to a novel method of mutation analysis of a target nucleic acid which comprises incubating a sample having the target nucleic acid in a reaction mixture, in the presence of at least one first and second nucleic acid, where incubation produces amplified products, vivlemore401-10.rng

Human Flt-1 DNA sequence, a target for siRNA inhibition SeqID 415

generating duplexes in the amplified products and detecting the presence or absence of a heteroduplex from the duplexes, where its presence indicates a potential mutation in the target nucleic acid and its absence indicates the absence of mutation in the target nucleic acid. The method and compositions of the invention may be useful for analysing mutation. The current sequence is that of a PCR primer of the invention which RD (polycystic kidney disease). The current sequence is that of a PCR primer of the invention which was used to amplify human polycystic kidney disease PKD-1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting Ig-unmutated chronic lymphocytic leukemia in a subject involves determining over expression of ZAP-70 molecule in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of detecting Ig-unmutated chronic lymphocytic leukaemia (CLL)/small lymphocytic lymphoma (SLL) in subject. The method involves determining whether the subject overexpresses ZAP-70, which is used a marker for CLL/SLL. Also disclosed is a kit for detecting overexpression of ZAP-70 in a subject, preferably human. The present sequence represents a PCR primer used in
                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ig-unmutated; chronic lymphocytic leukaemia; CLL;

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit angionesis. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain region) genes, as well as mutants derived thereof. The present invention describes sense and antiense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, agerelated macular degeneration, inflammatory disease, psoriasis and related macular degeneration, inflammatory disease, psoriasis and cancers including breast, retinoblatoms, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, and indiabetic, and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic

Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VBGF), the VEGF receptor (FIt-1) and the FIk-1/KDR (kinase domain certaion) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic compert is useful for treating diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, agenciated macular degeneration, inflammatory disease, psoriasis and rehematoid arthritis. Furthermore, it can be used to treat various cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antiinflammatory, antipporiatic, antidiabetic and antiarthritic activities. This oligonucleotide is a human Fit-1 DNA coligo, a target for siRNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel predictor set comprising a plurality of polynucleotides and/or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. The molecules of the invention demonstrate cytostatic, antiangiogenic, vasotropic and vulnerary activities and may be useful in the field of pharmacogenomics, in particular for determining drug sensitivity and in treating breast cancer, hypervascular diseases, angiogenesis and scars in wound healing. The current sequence is that of an antisense RNAi (interfering RNA) DNA-RNA hybrid oligonucleotide which was targeted to a human protein tyrosine kinase biomarker polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New predictor sets with a plurality of polynucleotides and/or polypeptides whose expression pattern predicts cell response to a compound that modulates protein tyrosine kinase activity, useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prode to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer method represents a modified amplified fragment length polymorphism and partic, useful for genome fingerprinting, i.e. for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer directed sprimer, comprising of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic, useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons

This sequence represents an oligonucleotide used in the construction of gag-pol expression cassettes. The invention relates to a retroviral vector construct which consists of a 5'-long terminal repeat (5'-LTR); a tRNA binding site; an origin of second strand DNA synthesis, a 3'-LTR and gag/pol sequences modified to contain two or more stop codons. The invention also relates to a gag/pol expression cassette, and an envexpression cassette. The retroviral construct has anticaner, antiviral and immunomodulatory activity. The retroviral constructs are used to produce recombinant retroviral particles for use in gene transfer, particularly gene therapy, e.g. to deliver heterologous sequences that encode cytotoxins, produng activators, replacement genes, antisense

The invention relates to a gag/pol expression cassette comprising a promoter, a gag/pol gene (I) and a polyadenylation sequence in which the 5' end of (I) has been modified to contain codons that are degenerate for gag, or the 3' end of (I) has been deleted without affecting the biological activity of the encoded integrase. The expression cassette and similar cassettes that express env protein, are used to produce recombinant retrovital particles by homologous recombination. These particles are gene transfer vectors, particularly for gene therapy of tumours or viral infections, also to induce an immune response, to treat or prevent diseases, or to suppress graft rejection or immune/autoimmune responses. This sequence represents an oligonucleotide primer used in construction of gag/pol expression cassettes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New gag/pol expression cassette, for preparing retroviral particles for gene therapy, comprises a promoter, a gag/pol gene, and a polyadenylation sequence, and cannot form a replication competent virus by homologous recombination.
                                                                                          gag/pol expression cassette; gag; pol; env; integrase; gene therapy; ss; tumour; cancer; viral infection; immune response; autoimmune response; graft rejection; cytostatic; antiviral; immunostimulant; PCR; primer; immunosuppressive; murine leukaemia virus 4070A amphotropic envelope; bovine growth hormone polyadenylation sequence; long terminal repeat.
                                                                      murine leukaemia virus; mouse; retroviral backbone; LTR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                   Human; inflammatory bowel disease; Crohn's disease; ulcerative colitis; single nuclectide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

cross-link; proteolytic degradation; fibrosis;

```
comprises cross-linked collagen molecules, where the resistance of the collagenous matrix against proteolytic degradation is controlled by controlling the ratio of hydroxyallysine cross-links to allysine cross-links comprising cross-linked collagen molecules, where the resistance of the collagenous matrix. The method is useful for by the collagen molecules, where the method is useful for treating a fibrotic condition in a mammal by administering to the mammal (preferably human) an effective amount of a composition which reduces the lysyl hydroxylation level of collagen telopeptides and thereby results in a collagenous matrix having a decreased ratio of hydroxyallysine cross-links. The method comprises administration of compound or composition that inhibits the activity or production of TLM encoded by a proble gene but not the activity or production of lysyl oxidase. The method is useful for treating fibrosis by inhibiting fibrotic processes, in tissue engineering or drug delivery. The method provides collagen cross-linked by hydroxyallysine cross-links which are more difficult to cross-linked by hydroxyallysine cross-links which are more difficult to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of obtaining a collagenous matrix which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anorectic; cardiant; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; notropic; neuroprotective; antiarkinsonian; anticonvulsant; osteopathic; antiarflammatory; dermatological; antiarthmatic; antilipaemic; gene therapy; fibroblast growth factor receptor 4; FGFR4;
                                                                                                                                                                                                                                                                                                                                                                                                                 Obtaining a collagenous matrix with modified resistance against proteolytic degradation, for treating a fibrotic condition, comprises controlling the ratio of hydroxyallysine to allysine cross-links.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  degrade than collagen cross-linked by allysine. New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections. Ort I, Padigaru M, Rieger DK; Guo X, Anderson DW, WPI; 2004-315567/29. Zhong M,

(CURA-) CURAGEN CORP.

Example 12; SEQ ID NO 146; 214pp; English.

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, antibacterial, fungicide, protozoacide, nootropic, virucide, antibacterial, fungicide, protozoacide, nootropic, or antibacterial, fungicide, protozoacide, nootropic, antiinflammatory, dermatological, antiathmatic, and antibodies cartilipaemic activity. A polymoleckide of the invention may have a use antibacterial, the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. CC treating, preventing or diagnosing diseases such as metabolic disorders, cliabetes, obseity, infectious diseases such as metabolic disorders, diabetes, obseity, infectious diseases such as metabolic disorders, cliabetes, parkinson's disease, pilppsy, immune disorders (Nypertension, atherosocialvis), neurodegenerative disorders, asthma, and various disease, epilppsy, immune disorders (osteoarthritis), heematopoietic disorders, inflammatory skin disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides constant and parances for use in therapeutic or diapostic acids and polypeptides of the invention sow homology to certain known human crissue typing, prevention show homology to certain known human proteins; NOVIa shows homology to confidence; nowed shows homology to complement factor receptor shows homelogy to shows homology to shows homology to shows homology to matrix metalloroteinase. Disperced shows homology to complement factor receptor shows shows homology to matrix metalloproteinaes-15 precursor; NOV4a shows homology to matrix metalloproteinaes-15 precursor; NOV4a shows homology to WDC3; NOV5a-5c show homology to T-lymphocyte surface antigen Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 polypeptide variant; NOV9a-8g show homology to alpha-2 macroglobulin-like polypeptide variant; NOV8a-8g show homology to antileukoproteinae 1 precursor; NOV9a-9j show homology to LIV-1 protein; NOV10a shows homology

suppressive invention describes at rypansor. The present invention suppressive intended that a factor (TSIF) processor. The present invention also describes: (1) the TSIF protein having the primary structural information of amino acids 1-553 of the 813-amino acid sequence of SEQ ID NO:2 (ADP74801) or its fragment or allelic variant having immunomodulating activity, (2) an isolated polymucleotide comprising a 2826 base pair sequence of SEQ ID NO:1 (ADP74800) which encodes the TSIF polypeptide; (3) a vector comprising the nuclaic acid; (4) a genetically engineered host cell comprising the expression vector; and (5) preparing a diagnostic assaay for detecting the presence of a Trypanozoon infection in a mammal. TSIF has immunosuppressive activity, and can be used in gene therapy. The TSIF polypeptide or polynucleotide can be used in preparing a medicament for suppressing the immune response in a mammal for treating autoimmune disorders. The present sequence represents a PCR primer for TSIF, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     otide derived from Trypanosomes, useful in preparing a
for suppressing the immune response in a mammal for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for identifying an organism using the intron sequence of the clock gene as DNA fingerprints. The method comprises the steps of: constructing a pair of primers for PCR capable of amplifying intron using consecutive nucleotide sequences before and after of the clock gene intron; amplifying intron by PCR using the pair of primers; sequencing the amplified intron DNA fragments; and identifying the organism to analyse the nucleotide sequence of the intron. The present sequence is a PCR primer used in the method of the invention.
to nuclear hormone receptor NOR-1; NOV11a-11j show homology to transmembrane protein-11ke; NOV12a-12c show homology to beta-necendorphin dynorphin precursor. The present sequence represents a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identification of organism using the intron DNA sequence of the clock gene as DNA fingerprints.

library for a single chain monoclonal antibody fusion reagent capable of binding a transcriptional associated biomolecule in vivo. The antibodies are useful in treating Hepatitis A and B respiratory syncitial virus, HIV, Junin virus, Herpes simplex I and II, rubella, cytomegalovirus, Varicella-Zoster virus, Epstein-Barr virus, measles, hantavirus, dengue, Ebola inter alia and cancer. Expression vectors that encode the fusion antibodies may be used in gene therapy. The methods can be used to create and isolate the fusion antibodies. The monoclonal antibody fusion reagent can be used to regulate transcription in vivo. AAX76591 to AAX76674 represent specifically claimed PCR primers used in the construction of a human sFv library
                                                                                                                                                                                                  Antibodies from libraries useful in treating viral infections and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a human gene encoding a capsid protein zeta subunit (zeta-COP). The invention also relates to a zeta-COP protein sequence. The present sequence represents a PCR primer used to amplify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    primers AAX34310-X34312 were used to PCR amplify and isolated cDNA clones encoding a human oestrogen receptor (AAX34309). The receptor can be used to identify ligands that bind to human oestrogen receptor. The ligands can be used in a method for preventing or treating an oestrogen receptor mediated disease or condition, such as abnormal bone resorption, a candidated cardiovascular disease, cancer, metabolic disorders, or central nervous system disorders. The ligand is especially used to treat osteoporosis, breast, uterine, ovarian or prostate cancer, diabetes or Alzheimer's
